ABSTRACT

This dataset originates from UNHCR's Results Monitoring Survey (RMS) conducted in 2024 across the Forcibly Displaced Myanmar Nationals (FDMN) camps in Cox's Bazar and Bhasan Char, as well as the surrounding host communities in Bangladesh. The survey was designed to measure the effectiveness of humanitarian interventions and their impact on refugee and host populations, in line with UNHCR's results-based management framework.

The data collection was carried out face-to-face to ensure accuracy and inclusivity, particularly given the limited access to telecommunications in refugee camps. Stratified random sampling was applied using UNHCR household databases to ensure statistical representativeness across key disaggregations, including age, gender, disability, site (Cox's Bazar/Bhasan Char), and population group (refugee or host).

SAMPLING PROCEDURE

Stratified random sampling was applied using UNHCR household databases to ensure statistical representativeness across key disaggregations, including age, gender, disability, site (Cox's Bazar/Bhasan Char), and population group (refugee or host).

WEIGHTING

The RMS used a stratified household sample with two strata: (i) refugee households and (ii) host community households. The primary sampling unit was the household. Design (base) weights were calculated separately for each stratum as the ratio of the estimated total number of households in the stratum to the number of successfully interviewed households in that stratum.
