Overview

ABSTRACT

The 2000 Azerbaijan Multiple Indicator Cluster Survey (MICS) is a nationally representative survey of households, women, and children. The main objectives of the survey are to provide up-to-date information for assessing the situation of children and women in Azerbaijan at the end of the decade and to furnish data needed for monitoring progress toward goals established at the World Summit for Children and as a basis for future action.

KIND OF DATA

Sample survey data [ssd]

UNITS OF ANALYSIS

Household, Women, Children

Scope

NOTES

The scope of the Multiple Indicator Cluster Survey 2 included the following sections and topics:

- HOUSEHOLD: Household characteristics, Household listing, Education, Child labor, Water and Sanitation, Maternal mortality, Salt iodization
- WOMEN: Women's characteristics, Child mortality, Maternal and Newborn health, Contraception, and HIV/AIDS knowledge
- CHILDREN: Birth registration and Early learning, Breastfeeding, Care of illness, Malaria, Immunization, Anthropometry

Coverage

GEOGRAPHIC COVERAGE

The 2000 Azerbaijan Multiple Indicator Cluster Survey (MICS) is a nationally representative survey of households, women, and children.

Sampling

Sampling Procedure

Sample Design

The sample for the Azerbaijan Multiple Indicator Cluster Survey (MICS) was designed as a self-weighted sample to provide estimates of World Summit indicators at the national level and for urban and rural areas. The enumeration areas and the households from the Population Census of 1999 formed the sample frame. An enumeration area comprised about 507 persons on the average. It was thus possible to use enumeration areas directly as primary sampling units (PSUs) for first stage selection. The total sample size for the Azerbaijan MICS was calculated as 6112 households. The average cluster size was determined as 24 households and 254 clusters were selected. The sample was selected in two stages. At the first stage, the 254 clusters were distributed to three domains (the Baku area, other urban areas and rural areas) proportionately according to their size. The enumeration areas in each of the three domains were geographically sorted using the nine zones designated during the Soviet era but still in use in the country, albeit in a more limited fashion. Enumeration areas were selected with probability proportional to size, separately from the three domains. The household lists were updated in each selected enumeration area by using several computerized lists originating from the census, as well as the actual household questionnaires from the census, for the primary reason of including IDP/refugee households in the sample. During the second selection stage, households were systematically selected using a fixed sampling interval. A total of 6166 households were selected. The difference between the number of households selected and the target number of households is attributed to rounding during the selection procedures and the presence of multiple households in the selected households. Full technical details of the MICS sample are included in Appendix A of the final report.

Response Rate

Of the 6166 households selected for the Azerbaijan MICS sample, 6044 were found to be occupied (Table 1). Of these, 5861 were successfully interviewed for a household response rate of 97 percent. The response rate was similar in urban and rural areas. In the interviewed households, 7488 eligible women aged 15-49 were identified. Of these, 6959 were successfully interviewed, yielding a response rate of 93 percent. In addition, 2004 children under age five were listed in the household questionnaire. Of these, questionnaires were completed for 1875 children for a response rate of 94 percent.

Questionnaires

Overview

The questionnaires for the Azerbaijan MICS were based on the MICS Model Questionnaire with some modifications, additions, and deletions. A household questionnaire was administered in each household, which collected information on household members including sex, age, literacy, marital status, and orphanhood status. The household questionnaire also includes education, child labor, water and sanitation, maternal mortality, and salt iodisation modules, as well as several questions on household amenities. In addition to a household questionnaire, questionnaires were administered in each household for women age 15-49 and children under age five

Data Collection Notes

The field staff was trained in two stages. During 7 days in June 2000 a group of 17 interviewers were trained, to take part as interviewers in the pretest and to participate in the main training and fieldwork as trainers, regional coordinators, supervisors and editors. The main training was carried out in July during a six day long training session. A total of 67 individuals were trained during the main training session, and a two-day pilot study was conducted upon the completion of training. In the main fieldwork, ten teams collected the data. Each team comprised three interviewers, one editor, one supervisor and one driver. Two regional coordinators provided constant monitoring of the fieldwork. The MICS Coordinator provided overall supervision. The fieldwork began on 1 August 2000 and concluded on 29 August 2000.

Questionnaires

The questionnaires for the Azerbaijan MICS were based on the MICS Model Questionnaire with some modifications, additions, and deletions. A household questionnaire was administered in each household, which collected information on household members including sex, age, literacy, marital status, and orphanhood status. The household questionnaire also includes education, child labor, water and sanitation, maternal mortality, and salt iodisation modules, as well as several questions on household amenities. In addition to a household questionnaire, questionnaires were administered in each household for women age 15-49 and children under age five

Data Processing

Other Processing

Data were entered on fifteen microcomputers using the ISSA software. Appropriate changes to the initial software were made in accordance with the modifications in the Azerbaijan MICS questionnaire. In order to ensure quality control, all questionnaires were double entered and internal consistency checks were performed. Procedures and standard programs developed under MICS and adapted to the Azerbaijan questionnaire were used throughout. Data processing began on 7 August 2000 and finished on 20 September 2000.
