Overview

ABSTRACT

The 2000 Sierra Leone Multiple Indicator Cluster Survey—2 (MICS2) is a nationally representative survey of households, women, and children. The main objectives of the survey are to provide up-to-date information for assessing the situation of children and women in Sierra Leone at the end of the decade and to furnish data needed for monitoring progress toward goals established at the World Summit for Children and as a basis for future action.

KIND OF DATA

Sample survey data [ssd]

UNITS OF ANALYSIS

Households, Women, Children

Scope

NOTES

Household: Household information panel, Education, Child labor, Water and Sanitation, Salt iodization, Disability and Maternal mortality.

Women: Child mortality; Tetanus toxoid, Maternal and Newborn health, Contraceptive use, HIV/AIDS

Child: Birth registration and early learning, Vitamin A supplementation, Breastfeeding, Care of illness, Malaria, Immunization, Anthropometry

Sampling

Sampling Procedure

The sampling methodology used in the MICS2 survey was designed to provide estimates of health and education indicators at the national level, for urban and rural areas, and for the four regions of Sierra Leone: North, South, East and West. The sample was selected in three stages using a stratified cluster sampling methodology. Sierra Leone has been demarcated into 2,546 enumeration areas (EAs) for the purpose of collecting census data. The current population of each EA in Sierra Leone was estimated through the use of key informants at the chiefdom level. Refugee camps containing Internally Displaced Persons (IDPs) were considered to be additional EAs and were included in the sample frame of EAs in order to ensure that IDPs were adequately represented in the survey. Based on the EA population estimates, randomized systematic sampling was used to select 225 EAs for the survey. The probability of an EA's selection was proportional to the size of its population⁴, resulting in a self-weighting sample. Selected EAs were divided into segments of approximately 100 households each with the aid of a local informant. Maps of the selected EAs, maintained in the Cartographic Section of the CSO, were used to guide this "segmentation". One segment in each EA was then randomly selected. The map of this segment was then updated. This segment was then divided into pieces of approximately 20 households, one of which was randomly selected for inclusion in the survey. All households in the selected piece were listed on the Household Listing Form for the EA and included in the survey. This approach to sampling yielded an overall sample size of 4,566 households. A household was defined as "a group of people who all eat from the same pot", in line with the definition of household used in previous surveys in Sierra Leone. Five of the selected enumeration areas were not surveyed because they were not accessible during the enumeration period. Data from twelve additional EAs in the North that were surveyed were not processed because the fieldworkers had to flee Makeni when hostilities resumed between RUF and government forces in May 2000. Sample weights were used for reporting results to compensate for the seventeen clusters that were not included in the final database. Full technical details of the sampling plan are detailed in Appendix C.

Response Rate

As noted above, hostilities between the Revolutionary United Front (RUF) and forces aligned with the Government resumed during the final week of data collection for the MICS2 survey in May 2000. As a result, one cluster in the East and four clusters in the North could not be surveyed. Completed questionnaires from twelve clusters in the Northern region that had already been surveyed were stranded in Makeni when enumerators could not return to collect them. The completed questionnaires had been stored there for safekeeping while the survey team had traveled to remote regions to survey other clusters. Data from eight of these clusters have been retrieved recently and will shortly be added to the MICS2 database. In the original sample of 225 EAs there were 4566 households selected for the survey. There were 4207 households selected for the survey in the 208 clusters that were successfully surveyed and entered into the database. 4021 of these 4207 households were found to be occupied and were successfully surveyed, yielding a household response rate of 97 percent (Table 1; see Appendix F). In the interviewed households, 5750 eligible women (age 15-49) were identified. Of these, 4923 were successfully interviewed, yielding a response rate of 85.6 percent. In addition, 3060 children under age five were listed in the household questionnaires of surveyed households. Questionnaires were completed for 2764 of these children for a response rate of 90.3 percent.

Questionnaires

Overview

The MICS2 manual provides a carefully constructed core questionnaire that is extremely comprehensive in nature. The core questionnaire is made up of three questionnaires: Household questionnaire, Questionnaire for women, and Questionnaire for children. Explicit instructions are given regarding the addition and subtraction of questions to the core questionnaire. Very minimal modifications were made to the questionnaires for the purpose of the Sierra Leone MICS2. Optional modules such as the Disability Module and the Maternal Mortality Module were modified and added to the core questionnaire. Several additional questions were incorporated into existing modules to provide information pertinent to development and relief efforts in Sierra Leone. Any additions to or deletions from the core questionnaire were done within the guidelines detailed in the MICS2 manual. The household questionnaire was administered in each household. This questionnaire collects information on household members including sex, age, literacy, marital status, and orphanhood status. The household questionnaire also includes modules on education, child labor, water and sanitation, salt iodization, disability and maternal mortality. The Questionnaire for women and Questionnaire for children were administered in each surveyed household for women age 15-49 and children under age five. For children, the questionnaire was administered to the mother or caretaker of the child.

Data Collection Mode

Face-to-face [f2f]

Data Collection Notes

Data collection commenced immediately following the training of enumerators in late March 2000. The first two days of data collection took place in the Western region under the strict supervision of the Survey Coordinator, the UNICEF M&E Officer and the MICS2 Survey Consultant. These three individuals served as supervisors for both the Enumerators and Technical Supervisors. Common mistakes in both enumeration and supervision were observed and immediate feedback was given to the enumerators and supervisors. Based on this experience a Supervision Plan and Supervision Checklist were developed. The Survey Coordinator and the UNICEF M&E Officer used these supervisory tools to guide their subsequent supervision in other regions. Enumerators worked together in EAs in teams of four, and were accompanied by Technical and Associate Supervisors throughout the survey. Enumerators worked individually within households. Data collection continued for approximately five weeks and finished in early May 2000. Public sensitization for the survey was done on radio in all regions prior to the survey.

Questionnaires

The MICS2 manual provides a carefully constructed core questionnaire that is extremely comprehensive in nature. The core questionnaire is made up of three questionnaires: Household questionnaire, Questionnaire for women, and Questionnaire for children. Explicit instructions are given regarding the addition and subtraction of questions to the core questionnaire. Very minimal modifications were made to the questionnaires for the purpose of the Sierra Leone MICS2. Optional modules such as the Disability Module and the Maternal Mortality Module were modified and added to the core questionnaire. Several additional questions were incorporated into existing modules to provide information pertinent to development and relief efforts in Sierra Leone. Any additions to or deletions from the core questionnaire were done within the guidelines detailed in the MICS2 manual. The household questionnaire was administered in each household. This questionnaire collects information on household members including sex, age, literacy, marital status, and orphanhood status. The household questionnaire also includes modules on education, child labor, water and sanitation, salt iodization, disability and maternal mortality. The Questionnaire for women and Questionnaire for children were administered in each surveyed household for women age 15-49 and children under age five. For children, the questionnaire was administered to the mother or caretaker of the child.

Data Processing

Other Processing

Completed questionnaires were checked in the field by supervisors and then transported to Freetown, where Verifiers checked each questionnaire to make sure that it had been clearly and correctly completed. Questionnaires were then given to Data Entry Operators for entry into the database. Much of the software that was used to enter, process and analyze the data from the MICS2 survey had been previously developed by UNICEF Headquarters and merely needed to be modified for use in the Sierra Leone MICS2 survey. The software that was used to enter and process data was run in the EpiInfo6 software program. Data were entered on fourteen microcomputers that were rented for the purpose of the MICS2 survey. All questionnaires were double-entered and then verified using EpiInfo's Validate routine. CSO staff oversaw all aspects of data processing and management. Procedures and standard programs developed for MICS2 by UNICEF and adapted to the Sierra Leone questionnaire were used throughout the data management process. Data entry/processing began in June 2000 and was completed in September 2000.
